INVESTING IN THE TOP DIVIDEND STOCKS

After many years of investing, one tends to develop strategies that work. Some more successful than others.

Investing in dividend paying stocks is nothing new, this strategy was used when the current stock market opened in 1602 (there were previous attempts for a managed market to trade shares of ownership in public and private companies, all failed). Investors would buy the stock just to collect the dividends.

This strategy works well when you have some insight on what is happening in the market and the companies run strong and successful.

What do I mean by that? Stock prices fluctuate for many reasons, some directly connected to the stock market, others are just public reaction or public over reaction to news events.

There are certain events, some planned and some unplanned, that happen which affect the pricing of certain stocks. Some unplanned events, like the oil spill in the Gulf of Mexico, deeply affected some oil stocks and then there was the trickle down effect from the oil on the gulf beaches affecting some hotels and resorts.

The Gulf War affected some different stocks, as do class action lawsuits and other events that you cannot plan for. These “unforeseen events” do affect some stock prices. Most of them have nothing to do with the stock market or some of the companies that are affected... It more or less comes down to the public's reaction to it and the news that comes along with it.

We can't really plan to trade and take advantage of those events because they are, as they are called, “unforeseen events”. They just happen and the best any trader can do is react to the news and make their best play.

On the other hand there are the “known events” that as investors... we can plan a strategy to trade and make a profit on. “Known events” can be anything that everyone knows about.

Christmas, New Years Eve, Black Friday and many other government approved holidays are a few. Then there are the changing of seasons, Spring, Summer, Fall and Winter. These are noted as being seasonal events. Yes, there are a couple of good trading strategies to take advantage of seasonal trends.

The Granddaddy of them all would be “Quarterly Reports”. The S.E.C. Which was formed as part of the new deal by president FDR. After the stock market crash of 1929 and the beginning of the great depression.

The S.E.C. Passed laws and regulations requiring all publicly held companies to give out quarterly reports so we all know what is going on inside the company. These regulations were designed to keep the boys on Wall Street somewhat honest, as we all know that is not as easy as it was originally intended to be.

The laws do keep almost all companies in line with staying honest and thankfully we as investors use that bit of knowledge to help us feel better about those that do not abide by the rules.

When companies are profitable they have to decide what do with the money... Invest it back into the company... or share it with the stock holders, that's us.

That my friends is the main reason for this trading strategy, here again are the main points of this 10minute strategy:

#1 Profitable companies share their profits.

#2 You don't have to own the stock all year to qualify for a share of those profits.

#3 When a company pays out a dividend, we get notified and their name goes on a list.

#4 There are over 3500 profitable companies this year and 220 trading days. Almost every day some profitable company will be paying out a dividend.

#5 Our special dividend capture calculator, we know ahead of time which company's are the best to invest in to put the odds in our favor.

Those 5 reasons bring us to the next section of this special report.

The so called "Special Dividend Capture Calculator" is something we came up with after many years of trading stocks. Many months of trial and error. It is unlike the trading systems out there that has you watching charts and waiting for an opening. This gives you solid numbers to base your trades on.

The Dividend Capture Calculator looks at solid factual numbers, the stock opening price, the high of the day, the low of the day. These numbers cannot be massaged to work in anyone's favor. These numbers are what they are... solid facts. The Ex-dividend date, that is another thing that cannot be fiddled with, it is what it is.

We took these numbers and dates, along with some mathematical calculations and long equations. We found patterns that are easily recognizable. They were easy enough that we designed a trading strategy and tested it with a very high success rate.

Dividend Stock Calculator

Let's look at what this calculator retrieves for us. I entered in the 50 top yielding dividend stocks and let it do it's thing.

	Symbol	Price	Dividend	Yield	20 DMA	10 yr prf	D/C str
1	CHKR	19.84	0.49	10.14 %	3.31 %	100.00 %	100.00 %
2	MTGE	23.55	0.70	12.00 %	1.11 %	75.00 %	100.00 %

50	WHZ	18.54	0.24	5.31 %	3.21 %	0.00 %	0.00 %

As you see, some explaining as to what all this means.

The first four columns are self explanatory.

Column 5... 20 DMA is the 20 day moving average, how much the stock moves on an average day. This is not the 20 day moving average that some of you may be thinking of. This average is calculated over the most recent 20 days as it relates to the opening price of the day. The opening price of the day is the only number that is manipulated by just one person. The market maker is the one person that sets the trading price of the day. The market maker calculates the stock movement over the past few days along with any news about the company they he has been following. It is not uncommon for a market maker to track only one stock, he is the one person that knows the most of that particular company. Some of the larger companies have more than one market maker but the fact of the matter is... the opening price is the only number that is set by just one person. The high of the day and the low of the day is set by traders buying and selling that companies stock. The market maker is responsible for buying and selling whatever price he posts as the "BID" or the "ASK".... if he posts it... then that is what it is.

Column 6... 10 yr prf is for the "**dividend on steroids**" trading strategy and shows how well the stock performed over the last 10 years. I like to trade only those stocks that have a score of 80% or higher for this strategy.(Shall I assume that you have read that book or at least watched the video on this subject)

Column 7... "D/C str" is for the "**dividend capture**" strategy over the last 10 years. These I won't trade below 90% because the profit is smaller.(Dividend capturing was the very first book "HOW TO RECEIVE 10-20 CHECKS PER MONTH LIKE CLOCK WORK" in this series and the precursor to these trading strategies)

The charts above are set for the **Dividend Capture Strategy** and thus make the "**10yr prf**" look not so good.

Check out the chart below for the top picks for the "**10yr prf**". I like to cross reference these findings with the stock charts to make sure there is no huge trend going against me. Other than that I am good to go, I just check the right date for my entry and that is a feature coming soon, I'll let you know about it as soon as I have it complete.

	Symbol	Price	Dividend	Yield	20 DMA	10 yr prf	D/C str
1	CHKR	19.84	0.49	10.14 %	3.31 %	100.00 %	100.00 %
2	ARR	7.05	0.33	18.86 %	0.76 %	100.00 %	76.19 %
3	RSO	5.28	0.17	13.23 %	1.50 %	96.00 %	83.33 %
4	FTE	12.43	0.47	15.50 %	1.75 %	94.12 %	93.75 %
5	NLY	16.72	0.43	10.39 %	0.95 %	92.68 %	85.00 %
6	CYS	13.56	0.51	15.24 %	1.26 %	91.67 %	81.82 %
7	CIM	2.39	0.09	14.40 %	2.10 %	88.89 %	88.24 %
8	HTS	28.52	0.93	13.06 %	1.15 %	88.24 %	81.25 %
9	NYMT	6.94	0.28	16.26 %	1.77 %	86.21 %	85.71 %
10	AI	21.55	0.88	16.18 %	2.19 %	85.71 %	88.89 %

Here are some chart samples

Knowing what stock is going to move and when is the easy part of this investing strategy reading a chart of a company that you are about to invest in can be a little scary for some people.

Let's just look at a few simple charts.

Simple, easy to read. Both these companies are moving up.

These two companies are going sideways.

There are only three directions a company can go in, up, down or sideways (aka no-where).

As you can plainly see these three companies are trending down.

Let's not forget a few odd events that can raise a red flag or two when they pop up. You will encounter at some point what is called a "gap" in what seems to be a steady move.

Notice the GAP in the far right

There is usually a good reason for a gap in pricing, I tend to stay away from larger gap plays. The uncertainty of why it happened is a good enough reason for me to pass.

At some point you will see some really ugly charts like the one below, it doesn't seem to have any rhyme or reason to it at all.

No clear direction, very choppy and low volume.

As investors interested in only dividend paying stocks we need to understand them, but just a little. Dividend stocks are very attractive to investors that want some cash flow. They buy the stock and just collect the dividends, not buying and then reselling like we are doing. These investors hold for years. Then, there are the fund managers that need to have some income coming in on the books to look good for quarterly statements for their investors.

To sum it all up, dividend stocks have a tendency to stay in a specific range. A high and low for the year, and you want to stay away from buying at the extremes, stay somewhere in the middle and you'll do well.

On the following page you will find three stock charts and I want you to pick out the obvious one to invest in based on what you just read. Scroll slowly and read them as well as you can before reading the following page.

If you were paying attention you would have picked the first one WPO... and why is that? While the other 2 companies are good quality companies. They are both at an all time high on this chart. Yes they may go higher into uncharted territory but I have found that new highs or new lows are not something I want to invest in. I like to see the stock at a price it has already proven to do well with. It can be close to the high or close to the low but not there. Remember dividend stocks do fluctuate throughout the year, going to its high and coming back down to its low. We want to catch our little movement somewhere in the middle.

That first stock WPO is a very nice sample of what works well using this strategy.

Getting comfortable with chart reading is something that is going to take some time. If you stick to the basics you will do just fine.

Lets look at some stocks

Considering there are over 252 trading days in the year and the Aristocrats list is not even 60 stocks we are going to have to come up with some more companies. The Aristocrats list is just one high quality dividend stock list that some professionals use for their investing. These may be the cream of the crop but there are some other companies that are just as good if not better investments with higher returns.

This next list has a little more information to help choose a good company to invest in.

25+ Straight Years Higher Dividends

As you can see there are 105 companies on this list and some may also be on the Dividend Aristocrats list too. These guys have just a few minor adjustments to their criteria to make this list. You can see that they also have been increasing their dividend payout for over 25 years some are close to 50 years or more.

You now have over 150 high quality stocks to choose from, however if you really want to take your trading to the next level and increase your returns well into the double digits check out this [Dividend traders page](#) , there you can see over one years worth of trades, both winners and losers. The ROI is too high to print as most people will never believe unless they actually see all the proof.

Now you have two list of stocks and access to more quality companies [can be found here](#). Some companies pay out once per year

some twice, some four times (quarterly) and some pay out once a month. When the company pays out more than once per year, it really messes up the return on investment (ROI).

The ROI is calculated as a one time investment, what is the direct return on the purchase then resale of the stock. The yield is the same calculation but drawn out over a one year period. Here is a simplified example... if ABC company is paying out a 5% yield and the stock is \$100... your ROI is \$5 if you hold the stock for one year.

If the ABC company pays out biannually (twice per year) your yield is the same 5% for the year but 2.5% ROI if you try to collect just the dividend and not hold the stock for the complete year. If ABC company decides to pay out quarterly the yield will still be 5% for those holding for the year and it will drop to 1.25% for those buying and selling just for cash flow. Drag this out to a monthly payment or 12 dividend checks the yield stays at 5% and traders are reduced one more time to .415% ROI... not really worth making the trade at that point. Yield and payment go hand in hand when trying to capture the best and highest possible return on invested dollars. A calendar, calculators, stock lists and the right strategy are all going to add up to very high returns, or if you just want a stronger portfolio to hold onto stocks... it is up to you.

Til then happy trading.

Wishing you all the best

Thank you

James A Gaudino Sr.

Now let's look at buying a stock once you figured out which one looks good. To simplify this process I suggest you just make a call to your online broker and have him walk you through one or two. Second option is [watching a video](#) of someone doing this trading strategy and you just copying what they do. Of course, I am assuming you are

using [ThinkorSwim](#) as a trading platform and you set your account to use the [ten minute trading strategy](#).

If you have chosen to use a different trading platform all the buy and sell signals are basically the same. Let's see if we can break this whole process down to it's simplest form.

#1 Open trading account
#2 Get familiar with trading platform

#3 Choose a stock from list
#4 Check out the chart
#5 Divide 5% of your portfolio by the ask price=how many shares to buy.
#6 Enter stock symbol, quantity, order type into spaces provided
#7 Submit order and review
#8 Final entry... now you own it.

Now, let's make a profit ... After figuring out which strategy we are using, Dividend capturing or Dividends on Steroids. We have made our entry and the calculator has given you the entry date in accordance to the ex-date.

Quick recap: Dividend Capturing... buy on or before ex-date, sell 2 days after ex-date as long as it is more than you paid for it.
Dividends on Steroids... buy 10 days prior to ex-date, sell day before ex-date or when profit target is reached. Alternative exit points are "trend reversal" "(4-5 days going the wrong way) max loss incurred (5-7% loss) and, of course, too much time passes with no movement at all.

As with anything new you should practice a bit first. Make sure the online brokerage you choose to go with allows you to use a practice account with virtual money (not real, paper money)

Just practice, practice and more practice. Make sure you attend our live online classes and informative [webinars every week](#).

Til then happy trading.

Wishing you all the best
